

Configuration Note 88014 – Version AK (12/08)

Avaya Definity G3, Prologix & S8300/S8400/S8500/S87x0

H.323

Overview

This Configuration Note is intended for Avaya certified Modular Messaging technicians/engineers who are familiar with Modular Messaging procedures and terminology. It also assumes that you are Avaya certified or very familiar with the features and functionality of the Avaya PBXs supported in this Configuration Note and the QSIG protocol.

Use this document in conjunction with *Modular Messaging Installation Guide* and the *Avaya PBX Administration Guide*.

Please read the entire document before attempting any configuration.

1.0 METHOD OF INTEGRATION

The H.323 integration provides connectivity with the Avaya PBX over an IP network. The connectivity between the Avaya Message Application Server (MAS) and the Avaya PBX is achieved over an IP-connected trunk defined as ISDN-PRI-equivalent tie lines. This integration passes call information and MWI using QSIG messages tunneled in the H.323 packet.

H.323 Trunks allows the Avaya PBX and the Avaya Message Application Server to communicate over a LAN.

Avaya MAS Requirements

**Important when using
Hyper-Threading capable systems**

PBX Hardware Requirements

PBX Software
Requirements**2.0 AVAYA MESSAGE APPLICATION SERVER REQUIREMENTS**

- Supported Releases: 1.1, 2.0, 3.x, 4.0

Note: If using an S3500, or any hardware that is Hyper-Threading capable, Avaya strongly recommends Hyper-Threading be disabled. Please refer to the Installation Guide for detailed instructions.

3.0 PBX HARDWARE REQUIREMENTS

Before performing the installation ensure the customer site has passed the Avaya Network Evaluation.

Definity G3 and S8500/S8700:

- TN2302 IP Media Processor for voice processing
- TN799C C-LAN for signaling

S8300:

- PROCR

3.1 PBX SOFTWARE REQUIREMENTS

Minimum Supported Software:

Definity G3 & Prologix: G3V10.1 Load 48

S8300/S8500/S8700: V1.1, V2.0, V3.0

PBX Software Packages:

- QSIG-Supplementary Services, QSIG Interworking with DCS, QSIG rerouting, QSIG transfer into Voice Mail, QSIG Value-Added comes with an optional "Advanced Networking Package."
- DCS+ for Multiple PBX Support (Refer to Section 9.0)
This option is **only** required for networking (multiple PBXs)

Note: Either DCS+ or QSIG Networks are necessary to support multiple PBXs (Centralized Voice Mail). No other networks are supported. Refer to Section 8.0 (Considerations) for additional info.

Important: Before ordering account teams should check with Avaya Services to determine if there are any applicable patches for customer specific configuration. Specifically if DCS+ or QSIG Networking is used.

3.2 LAN CONNECTIVITY

- Ethernet LAN connectivity - TCP/IP

3.3 CUSTOMER-PROVIDED EQUIPMENT

- Wiring necessary to support the physical LAN (CAT 3 minimum) Ethernet Hub (Location of 10baseT - Optional)

Supported integration features

4.0 SUPPORTED INTEGRATION FEATURES

[✓] Items are supported

System Forward to Personal Greeting

| | |
|----------------|-----|
| All Calls | [✓] |
| Ring/no answer | [✓] |
| Busy | [✓] |
| Busy/No Answer | [✓] |

Station Forward to Personal Greeting

| | |
|----------------|-----|
| All Calls | [✓] |
| Ring/no answer | [✓] |
| Busy | [✓] |

| | |
|---|-----|
| Auto Attendant | [✓] |
| Call Me | [✓] |
| Direct Call | [✓] |
| External Call ID (ANI) | [✓] |
| Fax | [] |
| Find Me | [✓] |
| Internal Call ID | [✓] |
| Message Waiting Indication (MWI) | [✓] |
| Multiple Call Forward | [✓] |
| Multiple Greetings | [✓] |
| N+1 | [✓] |
| Outcalling | [✓] |
| Queuing | [] |
| Return to Operator | [✓] |

IMPORTANT: PBX options or features not described in this Configuration Note are not supported with this integration. To implement options/features not described in this document, please contact the Avaya Switch Integration product manager.

PBX Configuration

5.0 SWITCH CONFIGURATION FOR IP INTEGRATION

The following tasks must be completed in the following order when programming the PBX to integrate. PBX programming is intended for certified PBX technicians/engineers.

- Verify customer option for H.323/QSIG trunking
- Administer QSIG TSC and Extension Length
- Assign Local Node Number
- Administer C-LAN and IP Media Processor circuit packs (G3 and S8500/S8700 only)
- Assign IP node names and IP addresses to C-LAN, IP Media Processor (G3 and S8500/S8700 only)
- Define IP interfaces (G3 and S8500/S8700 only)
- Administer IP Network Regions (Skip this step if default QOS is used)
- Administer Codec Type (Skip this step if default QOS is used)
- Add Message Server to the node names
- Create H.323 signaling group
- Create a new trunk group
- Modify the signaling group to add trunk group
- Create Route Pattern
- Modify AAR Analysis Table
- Modify AAR Digit Conversion Table
- Modify ARS Digit Conversion Table
- Define ISDN Numbering Format
- Create Coverage Path
- Create Hunt Group (Pilot Number)

Note: The screens shown in this section are taken from an Avaya Definity G3 administration terminal. Some parameters may not appear on all software releases.

NOTICE:

The screens in this Config Note are only for illustration purposes.

It is recommended that a qualified technician review the customer's configuration for accuracy.

***NOTE:**

DCS is only required for networking.

Stand-alone/single PBX do not require DCS, so those options may be set to "N"

****NOTE:**

Cvg of Calls Redirected Off-Net (CCRON) must be set to "y" if you are using *Find Me*.

5.1 VERIFY CUSTOMER OPTIONS FOR H.323/QSIG TRUNKING

Ensure all required software features are enabled on the PBX. Access the System Parameters Customer Options form. Below is an example of the forms required for QSIG integration, with the required features in boldface.

IMPORTANT: Only change the recommended fields.

```

display system-parameters customer-options                               Page 1 of 9
                                OPTIONAL FEATURES

                                G3 Version: V9                          Maximum Ports: 3600
                                Location: 1                             Maximum XMOBILE Stations: 100

IP PORT CAPACITIES
                                Maximum Administered IP Trunks: 150
                                Maximum Concurrently Registered IP Stations: 200
                                Maximum Administered Remote Office Trunks: 5
                                Maximum Concurrently Registered Remote Office Stations: 5

                                Maximum Number of DS1 Boards with Echo Cancellation: 332
                                Maximum VAL Boards: 10
    
```

Send Non-ISDN Trunk Group Name as Connected Name? n
Display Connected Name/Number for ISDN DCS Calls? y
Send ISDN Trunk Group Name on Tandem Calls? n
CPN Replacement for Restricted Calls: #202
CPN Replacement for Unavailable Calls: #202
QSIG TSC Extension: 2799
MWI - Number of Digits Per Voice Mail Subscriber: 4 (see note below)

National CPN Prefix:
International CPN Prefix:
Pass Prefixed CPN to ASAI? n
Unknown Numbers Considered Internal for AUDIX? y      Max Length: 5
USNI Calling Name for Outgoing Calls? n
Path Replacement with Measurements? y
QSIG Path Replacement Extension: 2798 (vacant extension)
Path Replace While in Queue/Vectoring? n
```

NOTE: This parameter must match the number of digits used for mailbox/extension length. For **multiple length extensions** leave this field blank. **Important:** The option to leave this field blank requires Avaya CM 2.1 and later.

Access the System Parameter Coverage-Forwarding and change or ensure the following parameters are set appropriately:

Maintain SBA At Principal? **n*** (*see note on left*)
 Coverage Of Calls Redirected Off-Net Enabled? **n**** (*see note on left*)

***NOTE:**

Maintain SBA at principal set to “n” ensures that when the call covers to voice messaging the appearance on the station is removed to ensure privacy. Doing this prevents someone from listening to the call as it is being recorded by the voice messaging system.

```

| n | | | | | | | 255.255.255.0 | . . . | | |

- Skip this step if default QOS is used. Define IP Network Regions. In this example network region '6' is selected.

```
display ip-network-region 6
```

Page 1 of 2

```

IP Network Region

Region: 6
Name: msgserver
Audio Parameters
Codec Set: 6

UDP Port Range (Note: 5000-5999 is the only range allowed by MM)
Min: 5000
Max: 5999

DiffServ PHB Value: 46          Direct IP-IP Audio Connections? n
                                IP Audio Hairpinning? n

802.1p/Q Enabled? n

```

NOTE1: If QOS is being administered, don't forget to include the network region in the CLAN and MedPro network region. In this example the CLAN and MedPro are using network region 6.

```
change ip-network-region 6 Page 2 of 2

Inter Network Region Connection Management

Region (Group Of 32)
1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2
001-032 6 6
033-064
065-096
097-128
129-160
161-192
193-224
225-250
```

NOTE2: The IP Network Region screen is different with the S8300. In addition to the codec-set=6, direct-WAN=y, and WAN-BW-limits=NoLimit

- Skip this step if default QOS is used. Administer Codec type. In this example codec set '6' is used. The default for the ip-codec-set and MAS is G.711MU.

```
display ip-codec-set 6

IP Codec Set

Codec Set: 6

Audio      Silence      Frames      Packet
Codec      Suppression  Per Pkt     Size(ms)
1: G.711MU      n           3           30
2:

5:
```

- Add the MAS to the IP Nodes Names. Enter the IP address assigned to the Message Server.

```
change node-names ip Page 1 of 1

IP NODE NAMES

NAME      IP Address
Default  0 .0 .0 .0
clan1    148.147.6 .246
medpro1  148.147.6 .163
msgserver 148.147.6 .123
```

- Create the signaling group for the H.323. The Near-end Node Name is the name assigned to the C-LAN above. The Far-end Node Name is the name assigned to the Message Server above. For the Far-end Network Region enter the number of the region created above. For this example signal group 299 was selected.

NOTE: If QOS was administered, make sure to enter the new network region in the Far-end Network Region field.

NCA-TSCs are used for QSIG.
 CA-TSCs are used with DCS+

 Trunk Group for NCA TSC should have a value to indicate trunk group only if using MWI Interrogation.

```
display signaling-group 299
                                SIGNALING GROUP

Group Number: 299                Group Type: h.323

                                Bit Rate: 1200                  Synchronization: async         Duplex: full
Disconnect Supervision - In? y  Out? n
Answer Supervision Timeout: 0
```

Tip: If the numbering format is set to **unk-pvt** then the PBX looks to the Private-Numbering Table to build the number. The network Level must be **0** and the Level 2 and 1 code blank or NO number will be sent. This is where the PBX builds the called party number for the integration. If it is set to **unknown**, the PBX looks at the Public-Unknown table where an entry is required to build to the number. If there is no entry in this table to build the number, NO number is sent.

Note: If you are using CM 4.0 or higher see next page

```

add trunk-group 299                                     Page 2 of 22

  20: ip  maschan20
    
```

NOTE: For multiple MAS, you must administer ports in a circular fashion (round robin) to distribute the load.

Change the ISDN Numbering - Private Network form to configure and ensure the PBX for the proper Network Level to be used. Below is a copy of the ISDN Numbering - Private Network form with the required field in **boldface**.

```

display isdn private-numbering

ISDN NUMBERING - PRIVATE FORMAT

Network Level: 0                               PBX Identifier:
  Level 2 Code:                                     Deleted Digits: 0
  Level 1 Code:
    
```

NOTES for Avaya CM 4.0 and later

Network Levels and Level codes are now found in *system-parameters features* under *Parameters for Creating QSIG Selection Numbers*

Note: If the numbering format is set to **unk-pvt** then the PBX looks to the Private-Numbering Table to build the number. Network Level must not be left blank (in most cases this is set to 0) or NO number will be sent. This is where the PBX builds the proper number (i.e., user's station number) for the integration to open the proper mailbox.

```

display system-parameters features                                     Page 8 of 17

```

PARAMETERS FOR CREATING QSIG SELECTION NUMBERS
Network Level: 0
 Level 2 Code:
 Level 1 Code:

NOTE: This parameter must match the number of digits used for mailbox/extension length. For **multiple length extensions** leave this field blank (this requires Avaya CM 2.1 or later). However, please note **MM supports only one mailbox length**.

In **Avaya CM 4.0** the Private Numbering Form is now used to define the number format for **specific** trunk groups. In our example screen below, we have a 4-digit extension length that includes extensions from 2000 thru 5999. The 4-digit number will be part of the QSIG number information that will be passed to the MM for call integration.

If you set numbering format to "unk-pvt" on page 2 of the trunk group form (see earlier in this section), which is for the MM Trunk Group, this form must be completed so the CM knows how to build the *private format* number. For that reason, do not leave the form blank or the MM call integration will fail.

IMPORTANT

This screen supports Private Numbering Plans (PNP) allowing you to specify the digits to be put in the Calling Number information element (IE), the Connected Number IE, and the QSIG Party Number for extensions in the Private Numbering Plan.

Avaya CM supports private-network numbers up to 15 digits in length. If the total number — including the level 1 and 2 prefixes, the Private Prefix (formerly known as PBX identifier), and the extension — is more than 15 digits long, neither QSIG Party Numbers nor the information elements are created or sent.

```

change private-numbering 3                                         Page 1 of 2
                                NUMBERING - PRIVATE FORMAT

Ext Len Code      Trk      Private      Total
  4  2           99      Prefix      Len
  4  3           99
  4  4           99
  4  5           99
                                Total Administered: 4
                                Maximum Entries: 540
    
```

- Modify the signaling group to add the new trunk group.

```

display signaling-group 299
                                SIGNALING GROUP

Group Number: 299                Group Type: h.323
                                Remote Office? n          Max number of NCA TSC: 10
                                Max number of CA TSC: 10
                                Trunk Group for NCA TSC: 1

Trunk Group for Channel Selection: 299
Supplementary Service Protocol: b

Near-end Node Name: clan1        Far-end Node Name: msgserver
Near-end Listen Port: 1720      Far-end Listen Port: 1720
                                Far-end Network Region: 6

                                Interworking Message: PROgress
    
```

- Create a Route Pattern for the trunk group created. For this example route pattern 299 is used, with trunk group 299 and the leading 3 digits are deleted from the aar number.

```

display route-pattern 299
                                Page 1 of 3
                                Pattern Number: 299

Grp. FRL NPA Pfx Hop Toll No.  Inserted          DCS/ IXC
No.   Mrk Lmt List Del  Dgts          QSIG
1: 299 0          3          y user
2: 300 0          3          y user
3:          (this is an example,          n user
4:          see note below)              n user
5:          n user
6:          n user

BCC VALUE  TSC CA-TSC      ITC BCIE Service/Feature BAND  No. Numbering LAR
0 1 2 3 4 W      Request  Dgts Format
Subaddress
1: y y y y y n n          rest          rehu
2: y y y y y n n          rest          none
3: y y y y y n n          rest          none
4: y y y y y n n          rest          none
5: y y y y y n n          rest          none
6: y y y y y n n          rest          none
    
```

Note: If adding additional MAS servers, ensure their Trunk Groups are added to this Route Pattern and follow the same programming as the 1st Trunk Group.

- Within the AAR Digit Analysis Table, create a dialed string that will map calls to the newly created Route Pattern. The dialed string created in the AAR Digit Analysis Table will be used later in the Hunt Group form that will define the MAS Hunt Group. Below is an example of an AAR dialed string in **boldface**.

```
add aar analysis 299
```

| AAR DIGIT ANALYSIS TABLE | | | | | | | |
|--------------------------|-----------|-----------|---------------|------------|----------|----------|------------------|
| | | | | | | | Page 1 of 2 |
| | | | | | | | Percent Full: 10 |
| Dialed String | Total Min | Total Max | Route Pattern | Call Type | Node Num | ANI Reqd | |
| 5187200 | 7 | 7 | 299 | aar | | n | |

- Modify the AAR Digit Conversion to allow MAS to dial and transfer to local PBX extensions. Ensure to administer a Matching Pattern for all extensions the voice messaging server (MAS) will be dialing.

```
display aar digit-conversion 0
```

| AAR DIGIT CONVERSION TABLE | | | | | | | | |
|----------------------------|-----|-----|-----|--------------------|-----|------|-----|------------------|
| | | | | | | | | Page 1 of 2 |

| 5 | 4 | 4 | 0 | | ext | n | n | n |
| 7 | 4 | 4 | 0 | | ext | n | n | n |

- Add Hunt Group. Configure a Hunt Group to be used as the Call Coverage Point for the Call Coverage Path assigned to the MAS subscribers. This hunt group's extension number is going to be used as the MAS Access Number. For the Coverage Path enter the Coverage Path number to be created in the next step. Enter the dialed string created previously in the AAR Digit Analysis Table in the "Voice Mail Number" field on page 2 of the Hunt Group form. Also, in the "Routing Digit (e.g. AAR/ARS Access Code)" field of this form, enter your PBX's AAR Access Code as defined on page 1 of the Feature Access Codes form. This hunt group is configured with no members assigned to it, and should be configured as follows:

```

add hunt-group 5                                     Page 1 of 60
                                                    HUNT GROUP

Group Number: 5                                     ACD? n
Group Name: msgserver                               Queue? n (see note below)
Group Extension: 7200                               Vector? n
Group Type: ucd-mia                                Coverage Path:
TN: 1                                               Night Service Destination:
COR: 1                                              MM Early Answer? n
Security Code:
ISDN Caller Display: mbr-name

```

Note: Queue? should be set to "n" as recommended. Refer to Consideration 8.10 for further information.

NOTE: The "Voice Mail Number" entered here must be administered in the "Voice Mail System Configuration->PBX->OutgoingCall" tab of the MAS. The number that is entered in the "Outgoing Call" tab is the Voice Mail Number.

```

add hunt-group 5                                     Page 2 of 60

                                Point6:
    
```

5.2 CONFIGURING ADDITIONAL MAS

The following tasks must be performed for each additional MAS.

- Add Message Server to the node names
 - Create H.323 signaling group
 - Change trunk group to include new signaling group ports.
- Add the new MAS to the IP Nodes Names

```

change node-names ip
                                Page 1 of 1
                                IP NODE NAMES
    Name           IP Address           Name           IP Address
default          0 .0 .0 .0           . . .
clan1            148.147.6 .246       . . .
medpro1         148.147.6 .163       . . .
msgserver       148.147.6 .123       . . .
msgserverB     148.147.6 .125     . . .
    
```

- Create H.323 signaling group. Follow the same instructions as the first MAS.
- Add the new signaling group channels to the previously created trunk group. In order to distribute the load between MASs the ports must be administered in a circular fashion (round robin).

```

add trunk-group 299                                     Page 6 of 22
                                                    TRUNK GROUP
                                                    Administered Members (min/max):
1/3
GROUP MEMBER ASSIGNMENTS                               Total Administered Members: 3

   Port      Code Sfx Name      Night      Sig Grp
1: ip        ms1-1  ms1-1
2: ip        ms2-1  ms2-1
3: ip        ms3-1  ms3-1
4: ip        ms1-2  ms1-2
5: ip        ms2-2  ms2-2
6: ip        ms3-2  ms3-2

..

58: ip      ms1-60  ms1-60
59: ip      ms2-60  ms2-60
60: ip      ms3-60  ms3-60
    
```

5.3 SUBSCRIBER ADMINISTRATION

Subscriber administration has two parts: Administering the MWI, and assigning the call coverage path.

Follow these steps to program the subscribers stations assigned to the MAS:

```

change station 7175                                     Page 1 of 5
                                                    STATION

Extension: 7175                                         Lock Messages? n      BCC: 0
Type: 6416D+                                           Security Code:        TN: 1
Port: 02B0209                                          Coverage Path 1: 2    COR: 1
Name: MM User                                          Coverage Path 2:      COS: 1
                                                    Hunt-to Station:

STATION OPTIONS
Loss Group: 2                                           Personalized Ringing Pattern: 1
Data Option: none                                       Message Lamp Ext: 7175

    Service Link Mode: as-needed
    Multimedia Mode: basic              Audible Message Waiting? n
MWI Served User Type: qsig-mwi       Display Client Redirection? n
                                        Select Last Used Appearance? n
                                        Coverage After Forwarding? s
    Automatic Moves: no                Multimedia Early Answer? n
                                        Direct IP-IP Audio Connections? n
                                        IP Audio Hairpinning? n
    
```

Per Station CPN – Send Calling Number must be set to “y” for the integration to work properly.

Note: Per Station CPN should be set to Y.

Single Line sets should have field “**Message Waiting Indicator**” set to “**led**” or “**neon**,” depending on the type of telephone set used. Also, the “**Number of Rings**” field should be set to a minimum of 4 rings, to allow Personal Assistance to work properly.

Save these PBX changes.

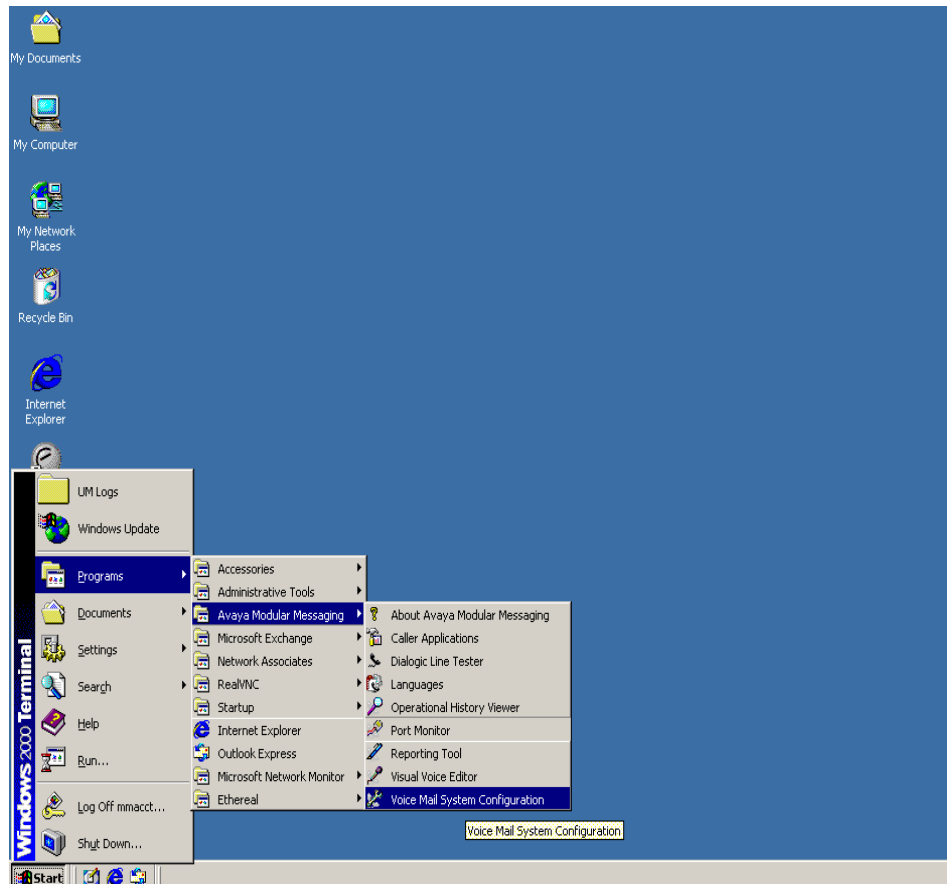

Please refer to section 8.0 at the end of this document for special PBX programming considerations.

Configuring the Message Application Server

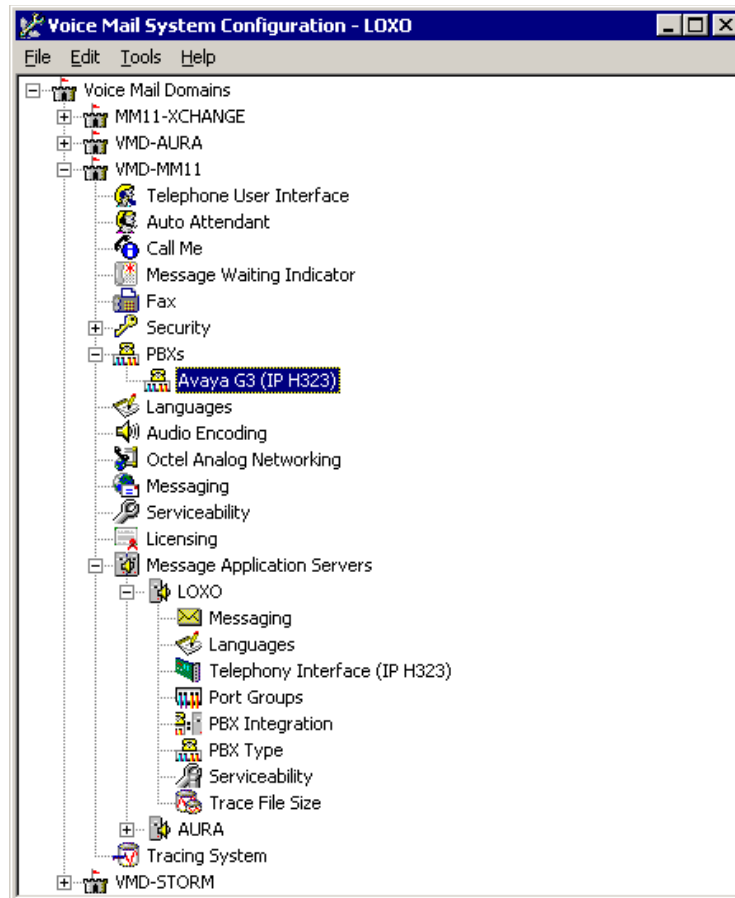

6.0 CONFIGURING THE MESSAGE APPLICATION SERVER

Configuring the MAS platform for proper PBX integration requires configuring several menus accessed within the **Voice Mail System Configuration** application, and a certified MM engineer. This must be performed for each MAS Voice Mail Domain (VMD).

- Access the **Voice Mail System Configuration** application from the MAS program group:

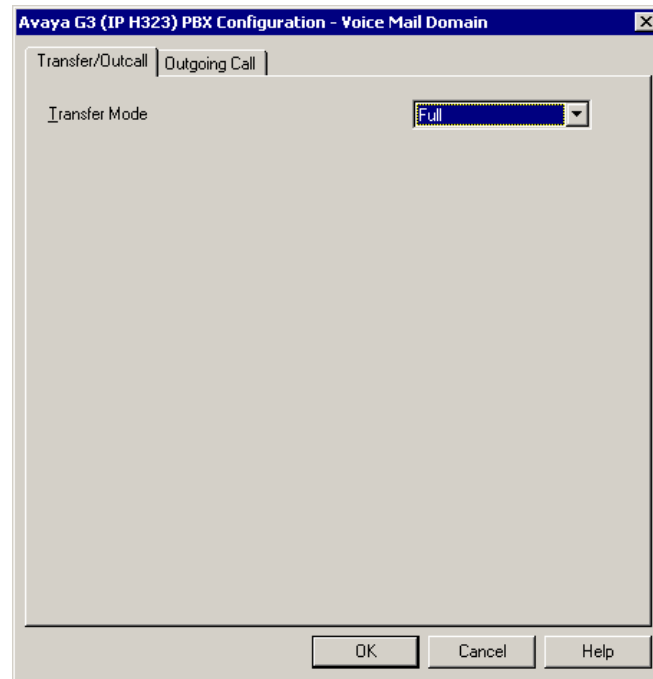

Expand all fields so all-applicable options are visible.

Ensure the new PBX is added as instructed by the Modular Messaging Installation guide. The new PBX should be:
Avaya G3 or MV (IP H323)

Select Voice Mail Domains

1. Expand **PBXs**
2. Select (double click) the **Avaya G3 or MV (IP H323)** PBX
3. Access the **Transfer/Outcall** tab

Transfer Mode = Full

NOTE: Administer transfers as FULL (Supervised transfer) to prevent callers from being disconnected when calls are re-routed back to the MAS. Transfers should only be administered as blind or partial when the transferred to numbers will not be re-routed to the MAS.

The following programming is a continuation from the Modular Messaging (MAS section) Installation Guide:

- Next access the **Outgoing Call** tab

The screenshot shows a configuration window titled "Avaya G3 (IP H323) PBX Configuration - Voice Mail Domain". It has three tabs: "Transfer/Outcall", "Tone Detection", and "Outgoing Call". The "Outgoing Call" tab is selected. The configuration fields are as follows:

| Field | Value |
|-----------------|-------------|
| Layer1 Protocol | G.711 A-Law |
| BC Transfer Cap | Speech |
| Number Type | Local |
| Number Plan | Private |
| Origin Number | 5187200 |

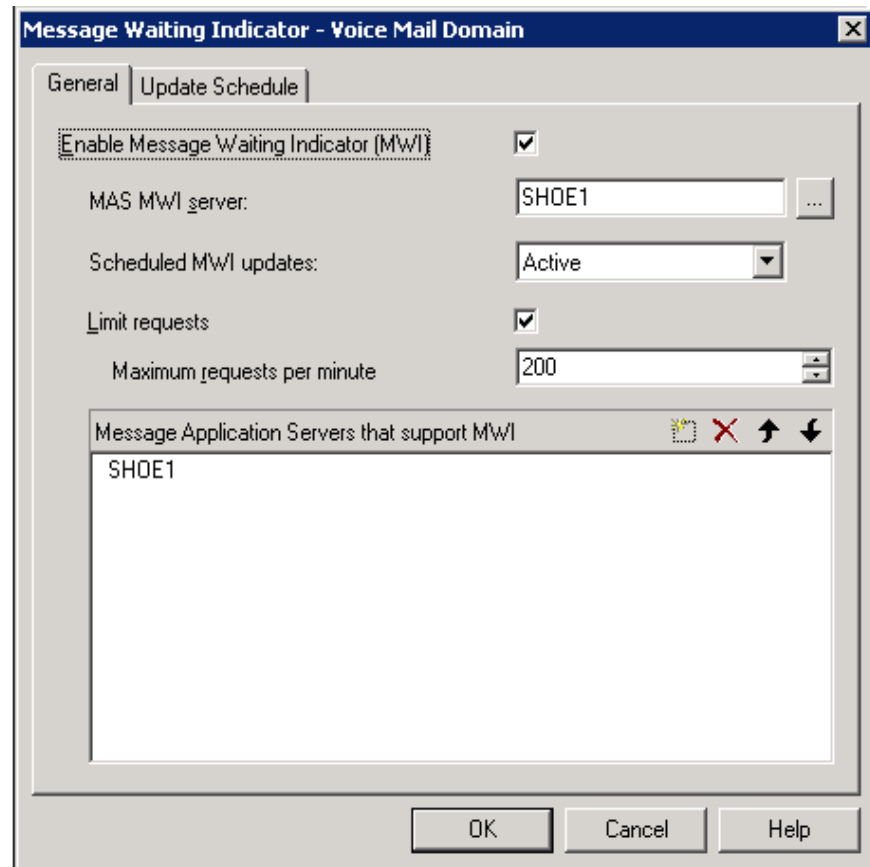

At the bottom of the dialog are three buttons: "OK", "Cancel", and "Help".

1. **Number Type** = Local
2. **Number Plan** = Private
3. **Origin Number** = 5187200 (The number entered here should be the number entered in the "Voice Mail Number" field on page 2 of the Hunt Group form)
4. Select **OK** to save changes

IMPORTANT: Confirm these values with your PBX vendor. If these values do not match the H.323 protocol, then transfer and out calling will not work.

Note: The MAS will prompt to restart the services. Wait until instructed below.

- Next access the **Message Waiting Indicator (MWI)** tab

1. **Enable Message Waiting Indicator (MWI)** = Enable by checking the box
2. **MAS MWI Server** = Enter the name of the MWI server created during the installation procedure.
3. **Scheduled MWI updates: Active or Inactive** = Configure as per customer requirements.*
4. **Limit requests** = Enable by checking the box
5. **Maximum requests per Minute** = 200
6. **Message Application Servers that Support MWI** = This box should contain a list of MAS servers capable of placing MWI requests.
7. Select **OK** to save changes

*Note: The Scheduled MWI updates parameter is only available on MM 3.x

- Next access the **Telephony Interface (IP H323)**
1. **Playback Volume** = 2 (Default)
 2. **Number of Ports** = **20** (maximum per MAS for MM2.0 or earlier)
-or- **30** (maximum per MAS for MM 3.0) **see note*

Important: The Ports are enabled by default. The MAS service must be restarted to allow port enabling/disabling.

***NOTE:** The max of 30 ports can only be attained when using an MM 3.0 with an Avaya S3500 server. (For additional details please refer to the Avaya MM Concepts and Planning Guide).

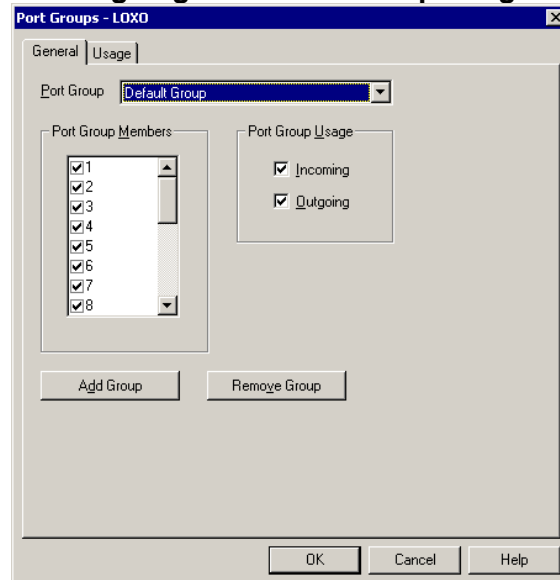

3. Select **OK** to save changes
4. Restart the MAS Service and then continue with the step below.

- Next access the **Port Groups** tab under the MAS name
 1. Click **Add Group** Button
 2. Name Group **MWI**
 3. Uncheck all of the ports, except the ports you will be using for MWI (please also refer to [Consideration 8.7](#))
 Note: The MWI port Group Usage should be checked [✓] outgoing only.

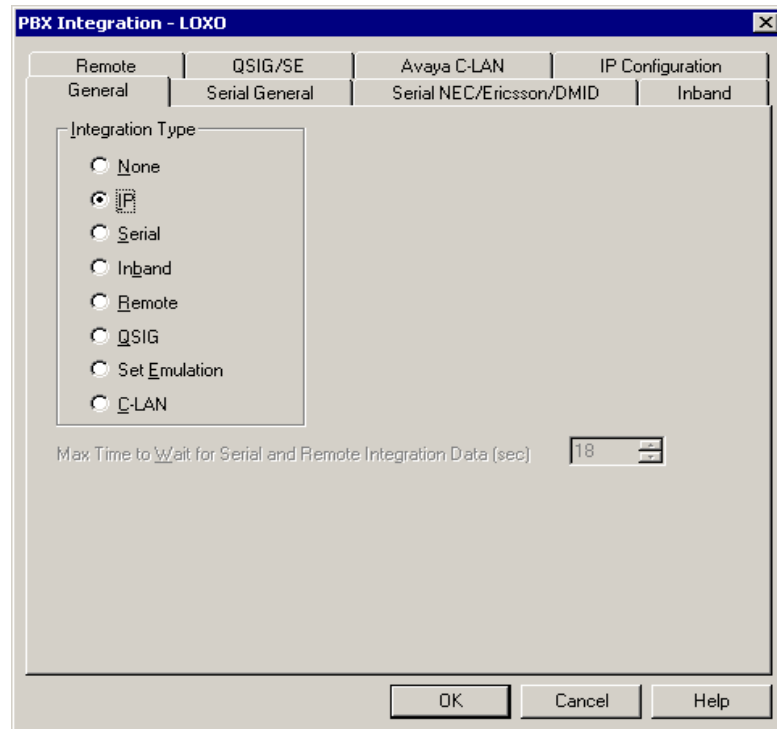

4. Then select the **Default Group** under **Port Groups** and ensure it is configured to meet the customer's need for **Incoming** and **Outgoing** under **Port Group Usage** and by checking all Ports

5. Select **OK** to save changes

- Next access **PBX Integration**

1. Within the **General** tab select **IP** for the **Integration Type**

2. Next select the **IP Configuration** tab

PBX Integration - LOXO

General Serial General Serial NEC/Ericsson/DMID Inband
 Remote QSIG/SE Avaya C-LAN **IP Configuration**

MAS Corporate IP Address: 148 . 147 . 22 . 21

PBX IP Address: 148 . 147 . 22 . 54

Port: 1720

 G.711-ALaw-64k

Move Up
 Move Down
 Add... Remove

OK Cancel Help

3. **Host IP Address** = IP address assigned to the **MAS CORP IP** (corporate network)
4. **PBX IP Address** = IP address assigned to the **PBX C-LAN** card or the **PROCR** (S8300)
5. **Port** = 1720
6. **UDP Port Range** = 5000-5999
7. **Packet size (bytes)** = 30
8. **Link test extension** = Leave blank
9. **Enable Tunneling** = Check box
10. **Enable Fast Start** = Check box
11. **Silence Suppress** = Uncheck box
12. **Max MWI Sessions** = 1
13. **Port Group Name** = MWI
14. **IP Supported Codec's** = Highlight G.711-uLaw-64k and Move Up
15. Select **OK** to save changes

- Next access the **General** tab within the **PBX Type** tab
 1. Scroll under the **Telephony Type** = IP H323
 2. Under **PBXs** ensure **Avaya G3 or MV (IP H323)** is selected

3. Select **OK** to save changes

After making these changes, return to “Configuring the voicemail system” within the S3400 Message Server Installation guide. Ensure you restart the Message Application Server services to apply these changes.

Important notes regarding this integration

8.0 CONSIDERATIONS

- 8.1 Before performing the installation ensure the customer site has passed the Avaya Network Evaluation.**
- 8.2 To minimize Quality Of Service (QoS) issues it is strongly recommended that the MAS and the IP PBX be connected on the same sub-net and to the same IP Network Switch.**
- 8.3 To prevent callers from being disconnected or receiving wrong integration information when callers are re-routed back to VS, administer transfers as FULL.** Transfers should only be administered as blind or partial when the transferred to number is not re-routed to the VS.
- 8.4 Currently Fax is not supported.**
- 8.5 Support for Transfer to QSIG Voice Mail feature.** In order to provide support for the Transfer to QSIG Voice Mail feature on your QSIG integrated MAS solution, you need to ensure the following criteria are met:
 - Your switch will need to be running Definity software R10 or later.

- You will need to have the following features enabled on your switch:
 - o ISDN-PRI or ISDN-BRI
 - o QSIG Supplementary Services
 - o Transfer to QSIG Voice Mail
- A Feature Access code for Transfer to QSIG Voice Mail will need to be configured.
- Your MAS Voice Server will need to be using the QSIG-MWI hunt group integration as described in this document.

Example on how the feature works:

- Extension 7001 has voice mail but calls received are forwarded to extension 7002 rather than directly to voice mail.
- Callers to 7001 are answered at 7002 but the caller wishes to leave a voice mail for the person at 7001.
- The person at 7002 transfer the caller directly to the voice mail for 7001 by pressing the transfer button, then the code for transfer to voice mail (*8,*50, etc.), then presses transfer again.
- **The caller immediately hears the greeting of 7001 (no additional ringing) and can subsequently leave a message.**

For full details on how to configure and implement the Transfer to QSIG Voice Mail feature on your Avaya switch, please consult your Avaya Definity Sales or Support representative.

8.6 When multiple Avaya PBX's are arranged in a QSIG network, care must be taken to configure the QSIG tie trunks properly. In order to provide full feature functionality to all subscribers, the trunk group(s) assigned to the QSIG tie trunks connecting all Avaya PBX's in the network must match the configuration of the trunk group form (page 1 and 2 of the form) assigned to the MAS QSIG trunks. An example of the trunk group administration form is illustrated on the PBX programming section of this document.

8.7 When running MWI on your Voice Messaging Server (MAS) you should setup a separate Port Group dedicated for MWI. If you are using a single MAS, one port is adequate. For multiple MAS you may need to increase the number of MWI ports to 2 or 3; or if using MM 3.0 or higher, you can create an MWI port group on each MAS to handle MWI needs. Only outgoing needs to be checked [if you are experiencing glare you should dedicate these ports for MWI by not including them in any other port group. **Note:** [Once the port group is created, this port group name must be entered in the PBX Integration -> IP Configuration tab -> Port Group Name field.](#)

8.8 Possible reasons for QSIG Path Replacement failure:

- When the QSIG Message Application Server Auto Attendant, Caller Application or Find Me features are transferring a call, you will see a second channel in Port Monitor appear busy until the transfer has been completed. After the transfer has been completed you will see that both channels are now idle in Port Monitor, this shows that the QSIG Path Replacement feature has completed successfully.
- However there are some switch configurations that will cause Path Replacement to fail, therefore your MM Server will stay bridge onto the transferred call, keeping two channels busy in Port Monitor. The following list of features can cause Path Replacement to fail:
 - **Call Vector.** A call that has experienced SS-CT (Supplementary Service Call Transfer) that terminated to a vector and received answer treatment can have its path replaced. This is allowed only after a true user answers the call so that vector processing is completed. A vector step of recorded announcement or wait listening to music could cause a CONNECT message to be sent back and make the far end think ANF-PR (Path Replacement Additional Network Feature) could take place. If the PR Propose is received while still in vector processing, the vectoring PBX will deny the ANF-PR attempt but will initiate its own attempt at ANF-PR when a user does answer the call.
 - **Malicious Call Trace (MCT).** While Malicious Call Trace (MCT) is active and if there is a trunk involved in the call, MCT feature does not allow the trunk resources to be released from the switch-side to facilitate the tracing activity. Also, a MCT controller on switch A may request a controller on switch B to continue tracing a call that was tandem through switch B by providing the trunk member id they wish to have traced. So, ANF-PR shall not be done while MCT is active on the call.
 - **Restriction Features.** *Class of Restriction (COR).* The restrictions placed on routing calls are in affect for ANF-PR. Any call that cannot be originated or terminated because of COR on a regularly dialed basis will not be originated or terminated when that call is made ON BEHALF OF that terminal by ANF-PR.
 - *Voice Terminal Restrictions.* Voice Terminal Restrictions for the reroute of an ANF-PR call will be enforced.

- *Inward.* If a terminal is Inward restricted then that terminal would not be able to accept an incoming call. This would include a new path SETUP message. Therefore a Requesting PBX should not bother proposing ANFPR, since it is destined to fail.
- *Manual Terminating Line.* If a terminal is Manual Terminating restricted then that terminal would not be able to accept an incoming call except from an attendant. Thus a new path SETUP would be denied. Therefore a Requesting PBX should not bother proposing ANF-PR, since it is destined to fail.
- *Origination.* If a terminal is Origination restricted then that terminal would not be able to make an outgoing call. Thus originating a new path SETUP should be denied. Therefore a Cooperating PBX should reject the path replacement proposal/request.
- *Outward.* If a station is outward restricted at the cooperating end of an ANF-PR call then no ANF-PR SETUP should be attempted and ANF-PR should fail. Any call that cannot be originated outward (because of COR) on a regularly dialed basis will not be allowed to originate outward when that call is made ON BEHALF OF that terminal by ANF-PR.
- *Termination.* If a terminal is Termination restricted then that terminal would not be able to accept an incoming call. Thus an incoming new path SETUP would be denied. Therefore a Requesting PBX should not bother proposing ANF-PR, since it is destined to fail.

8.9 H.323 integration (QSIG Protocol) does not support forwarding/transfer from a Vector. Currently, if calls are routed from a Vector to the QSIG link(s) connected to the MAS, the call will not pass the VDN as the called party ID. Applications requiring calls that are routed from Vectors to mailboxes on the MAS can be configured so as to route calls to phantom extensions (X-ports) configured to call-cover all-calls to the MAS hunt group.

Note: Patch 7960 corrects this. Avaya CM 2.0.1 and later releases include this fix/patch.

8.10 The Communication Manager does not support call queuing on QSIG trunks. Hence, calls cannot be queued to MAS ports. The user audible behavior is that during peak traffic, when all MAS ports are busy, a caller will hear a fast busy. They should hang up and try at a later time.

- 8.11 H.323 integrations may not be reliable for TTY** if the IP network is unable to support uncompressed audio with no packet loss. For this reason we currently do not support TTY with this integration.
- 8.12 Call transfers may not display the Call ID to ringing phones.** The Call ID is not provided until the subscriber answers the phone.
- 8.13 Trunk-to-Trunk is not required to support Find Me if the minimum releases indicated below are met.** Previously, when a public network call arrived at an Avaya™ Communication Manager system and was routed via coverage to a QSIG trunk connected to a Modular Messaging system equipped with the Find Me feature, the Find Me feature would place the call to the user and connect the calling and called parties. When the Communication Manager received the Transfer Complete messages from the Messaging system, and Path Replacement was enabled on the Communication Manager, it would proceed with the Path Replacement. While performing this task, the Trunk-to-Trunk Transfer parameter would be checked, and if set to “none”, the call between the calling party and the found user would be torn down. A change was put into the following releases and load numbers to correct this:
- 1.3 Load 537.0
 - 2.0 Load 226.0
 - 2.1 Load 411.0
- When the Communication Manager System is running on one of these loads or a later one, the Path Replaced call will not be torn down.
- 8.14 The Communication Manager supports up to 28 lines of input within the DCS to QSIG TSC Gateway.** This limitation affects how many entries can be configured for remote locations in a centralized voice mail environment.
- 8.15 AUDIX TUI and CALL SENDER Feature** – When using an AUDIX TUI the Call Sender feature will not function. Instead the user will hear the message, “This call is experiencing difficulties. Please try again later. Please disconnect.” And the call will then be terminated. The cause of this is currently under investigation. Please contact an integration specialist for any updated information.

9.0. ADDENDUM ON CONFIGURING MULTIPLE PBXS (DCS+ NETWORKING/INTERNETWORKING)

The following information is not intended for new installations. This Addendum assumes the customer has an existing Network already in place. Please refer to the appropriate PBX installation guide for brand new networking installations. Obtain a configuration printout of the existing network to use as a reference.

Ensure the integration is working properly within the PBX where the MAS will reside (Hub Node) before continuing with the networking configuration. Configure the remote switch (i.e. Node 2), Definity G3, Prologix, etc., by following the screens below.

The Hub Node will not require changes to the Trunk Group; however configure the Signaling Group, which will be assigned to the DS1 channels. The following is an example of the changes highlighted in **boldface**:

NOTICE:

The screens in this Config Note are only for illustration purposes.

It is recommended that a qualified technician review the customer's CM QSig programming for accuracy.

| | | | | | | | |
|---|--|----------------------|--|--|--|-----------------------------------|-------------|
| change signaling-group 7 | | | | | | | Page 1 of 5 |
| SIGNALING GROUP | | | | | | | |
| Group Number: 7 | | Group Type: isdn-pri | | Associated Signaling? y | | Max number of NCA TSC: 16 | |
| Primary D-Channel: 01A0824 | | | | Max number of CA TSC: 31 | | Trunk Group for NCA TSC: 4 | |
| Trunk Group for Channel Selection: 4 | | | | Supplementary Service Protocol: a | | | |

| | | | | | | | |
|---------------------------------|-------------|----------|------------------|--------------|-----------------|----------|--------------------------------------|
| change signaling-group 7 | | | | | | | Page 2 of 5 |
| ADMINISTERED NCA TSC ASSIGNMENT | | | | | | | |
| Service/Feature: | | | | | | | As-needed Inactivity Time-out (min): |
| TSC | Local | Enabled | Established | Dest. Digits | Appl. | ID | Mach. |
| 1: | 2299 | y | permanent | 2100 | dcs | 1 | |
| 2: | 3081 | y | permanent | 3083 | qsig-mwi | 2 | |
| 3: | | n | | | | | |
| 4: | | n | | | | | |
| 5: | | n | | | | | |
| etc.. | | | | | | | |

Note: The **Group Type** will depend on the customer's environment. The trunks can either be T1, E1, IP, etc.. For example, they could be:
 Group Type: **isdn-pri** or Group Type: **h.323**
 Additionally, you should consult with a Software Specialist to ensure the Numbering Format of the trunk group is configured appropriately to route Call ID to the Modular Messaging from remote switches.

On the Hub Node program the ISDN QSIG TO DCS TSC GATEWAY. This defines the stations that are DCS to another Node (in our example DCS Node 2). This allows MWI to be directed via DCS to Node 2 from the MAS.

```
change isdn qsig-dcs-tsc-gateway
```

| QSIG TO DCS TSC GATEWAY | | | | | | |
|-------------------------|------------|--------------|----------------------|------------|--------------|--|
| Subscriber Number | Sig Grp | TSC Index | Subscriber Number | Sig Grp | TSC Index | |
| 63xxx | 7 | 2 | | | | |
| 6409 | 7 | 2 | | | | |
| 6411 | 7 | 2 | | | | |
| 6412 | 7 | 2 | | | | |
| 6415 | 7 | 2 | | | | |
| 6430 | 7 | 2 | | | | |

Important: Use caution when completing this task. The data in this field will display exactly as it is entered. This is critical because when the switch makes a selection it will use the first match.

On the Hub Node program the ISDN DCS TO DCS TSC GATEWAY. This defines the stations using DCS to another Node (in our example DCS Node 2). This allows incoming calls from DCS Node 2 to be directed to the MAS.

```
change isdn dcs-qsig-tsc-gateway
```

| DCS TO QSIG TSC GATEWAY | | | | | | | | | |
|-------------------------|------------|--------------|----------------------|-------------------------------|------------|------------|--------------|----------------------|-------------------------------|
| Mach ID | Sig Grp | TSC Index | Voice Mail Number | AAR/ ARS Access Code | Mach ID | Sig Grp | TSC Index | Voice Mail Number | AAR/ ARS Access Code |
| 2 | 7 | 2 | 4575678 | 107 | | | | | |

The Remote switch (DCS Node 2) does not require changes on the DCS Trunk Group incoming to the Hub Node. However the Signaling Group for this Trunk Group requires changes. The following is an example of the changes highlighted in **boldface**:

```
change signaling-group 7                               Page 1 of 5
                SIGNALING GROUP

- Create a Call Coverage Path that will be assigned to the subscribers' stations. This Call Coverage Path will have the Remote Voice Mail Hunt Group as the Call Coverage Point. Below is an example of a Call Coverage Path.

```

display coverage path 3
                                COVERAGE PATH
                                Coverage Path Number: 3
                                Next Path Number:
                                Hunt after Coverage? n
                                Linkage
                                COVERAGE CRITERIA
                                Station/Group Status   Inside Call   Outside Call
                                Active?                n              n
                                Busy?                  Y              Y
                                Don't Answer?          Y              Y      Number of Rings: 4
                                All?                  n              n
                                DND/SAC/Goto Cover?    Y              Y
                                COVERAGE POINTS
                                Terminate to Coverage Pts. with Bridged Appearances? n
                                Point1: h2              Point2:
                                Point4:                 Point5:
                                                    Point3:
                                                    Point6:
    
```

- Configure the remote subscriber stations, assigning the newly created Call Coverage Path to them. They should also have LWC and the AUDIX Name set to AUDIX.

- continued on next page -

CHANGE HISTORY

| Revision | Issue Date | Reason for Change |
|------------|------------|--|
| Version L | 11/10/04 | Added a new field on page 2 of Hunt group from: "Send Reroute Request". Also added an "Overview" section. |
| Version M | 02/01/05 | Removed support of the IP600 (S8100) PBX |
| Version N | 03/15/05 | Included MWI Limit Request programming, Included NOTE on page 3, updated 8.12 |
| Version O | 05/02/05 | Updated page 2 of the Trunk Group. |
| Version P | 09/02/05 | Updated remote subscribers' configuration. |
| Version Q | 09/23/05 | Clarified UDP Port usage (5000-5999) |
| Version R | 10/18/05 | Updated to support ACM 3.0 |
| Version S | 2/17/06 | Added Consideration 8.15 regarding Call Sender issue with AUDIX TUI |
| Version T | 03/30/06 | Updated Consideration 8.11 regarding TTY support |
| Version U | 4/11/06 | Added: <ul style="list-style-type: none"> MM 3.0 to support release section 2.0 New MWI screen shot with Scheduled MWI updates parameter noted for MM3.0 |
| Version V | 5/22/06 | Changed Max port noted on page 24 from 20 to 30. Added Note to explain how to achieve 30 ports. |
| Version W | 6/22/06 | Changed IP Configuration tab screen shot (page 27) so packet size now shows 30 to match packet size as shown in item number 7 just below same screen shot. |
| Version X | 6/29/06 | Added note (in red) to Consideration 8.9 |
| Version Y | 8/11/06 | Revised consideration 8.7 for clarity and added note to MWI port group usage settings (Section 6.0) |
| Version Z | 9/01/06 | Re-revised consideration 8.7, corrected MWI example screen Section |
| Version AA | 1/24/07 | Added note regarding Interworking in Section 5.0 |
| Version AB | 2/1/07 | Added screens for <i>system-parameters coverage-forwarding</i> with explanation of <i>Maintain SBA at Principal</i> and <i>CCRON</i> enabled feature with explanation. Changed in Section 5.0: <ul style="list-style-type: none"> Added note for multiple length extensions on system-parameter features screen. Added sidebar adjacent signaling group form to explain NCA-TSC, CA-TSC, and Trunk Group for NCA-TSC Section 6.0 - Changed information clarifying what origin number entry should be on outgoing tab for PBX Type |

| | | |
|------------|------------|--|
| Version AC | 4/12/07 | Added sidebar about CCRON needing to be turned on in system-parameters customer-options screen in addition to the one already placed adjacent the <i>display system-parameters coverage-forwarding</i> screen. |
| Version AD | 6/1/07 | Updated Consideration 8.12 |
| Version AE | 6/20/07 | Added note regarding Hyper-Threading systems in Section 2.0 |
| Version AF | 10/29/07 | Highlighted CPN set to Y on station form in section 5.1 and added note for same. |
| Version AG | 11/08/2007 | Added new screens for Avaya CM 4.0 and related private-numbering format; updated sidebars; changed Dial Access parameter in trunk group screen to N. |
| Version AH | 12/03/2007 | Changed Consideration 8.12. |
| Version AI | 05/05/2008 | Updated to support MM 4.0 |
| Version AJ | 11/14/08 | Added note about setting " <i>Per Station CPN – Send Calling Number?</i> " on Station Form to Yes in Section 5.0 |
| Version AK | 12/17/08 | Updated screen shot for outgoing Tab in PBX Configuration in section 6.0 with updated Number Type and Number Plan as Local and Private respectively. |
